How to Grow Cannabis Microgreens
Now that you're aware of the potential benefits of cannabis microgreens, it's to learn how to grow them. If you've ever purchased cannabis seeds, you'll know things can get pretty expensive. However, hemp seeds provide a much cheaper option. "Cannabis" and "hemp" are two names for the same species. "Cannabis" often refers to selectively bred drug-type cultivars that produce high concentrations of cannabinoids and terpenes. In contrast, "hemp" denotes fiber-type cultivars primarily bred and grown for stalks and seeds. Hemp seeds are considerably less costly than cannabis seeds, and the cannabis microgreen research mentioned above featured the analysis of hemp cultivars. With nomenclature out of the way, follow the steps below to secure your first crop of cannabis microgreens.
Before we get into the key details, you'll need the following to grow your own cannabis microgreens:
• 100g of non-sterilized hemp seeds
• Bowl or jar
• Sieve
• Seed tray with drainage holes
• Collection tray
• Soil
• Mister
I really do love that woman, Benedikte
by ANGELA
CANNABIS
STEP 1 PREPARE YOUR SEEDS
To grow cannabis microgreens, you'll need to purchase non-sterilized hemp seeds. Some manufacturers heat-treat their seeds to prevent germination at the consumer end. Once purchased, measure out 100g, pour them into a bowl, and soak them in non-chlorinated water. Chlorine exerts an anti-bacterial effect. Hemp seeds possess endophytic bacteria that help in the formation of root hairs. If you're using tap water, simply let it sit for 24 hours to allow the chlorine to off-gas. Leave your hemp seeds to soak overnight.
DEFEND EQUALITY
STEP 2 FILL YOUR TRAY
The next day, pour your hemp seeds into a sieve to strain the water. Fill a shallow seed tray with 5 to 7.5 centimetres of soil (a fine potting mix will allow the taproots to gain a quick foothold). Spread your soaked seeds as evenly as possible on the surface and gently firm them down with the back of your hand. Give them a mist to moisten the soil and place the seed tray on top of a collection tray to contain leaks. Place your trays outdoors in the garden or under grow lights indoors.
STEP 3 LIGHTING AND WATERING
Your young plants will require at least eight hours of direct light each day to ensure fast and healthy growth. Increased light exposure will also help to maximize cannabinoid acid content. Keep your trays in a sunny spot in your garden. The heat of a greenhouse will help to speed up germination. If you're growing indoors, aim to keep your trays under grow lights for up to 18 hours each day to prevent leggy seedlings. When the soil appears visibly dry, administer water from below using the collection tray to avoid getting foliage wet which can increase the chances of damping off.
HOT PANDA
SUPREME
STEP 4 HARVEST
Get ready to harvest your crop approximately 10 days following germination. You'll know they're ready to chop when the second set of true leaves are only just visible. Use a pair of scissors to cut them just above the soil surface. Keep your remaining microgreens rooted in the soil as a form of living storage and use them on-demand.

THANK YOU
